YouFitness

Description

YouFitness is a fitness activity tracker app, that allows you to store your workouts. Create workouts, embed YouTube video and make your exercise plan. Keep track of every fitness activity and its details.

Intended User

YouFitness can be used by every person who is working out in the gym. It doesn't matter the workout type, the app will keep track of it.

Features

- Data sync between devices

- Personal user account;
- Workouts list;
- Embed YouTube video for every workout;
- Plan exercise program for each workout;
- Keep track of time spent for each workout session.

User Interface Mocks

Workouts List

The workouts list will display collection of all user's workouts. On phone and portrait tablet the collection is displayed as list of tiles. On landscape tablet the collection is displayed as grid of cards. Every workout item contains fields for:

- Workout name;
- Number of the exercises it is containing;
- Number of logs this workout was performed;
- Camera indicator if a YouTube video was embedded.

A floating Action Button will be placed on the bottom right corner of the screen. It is used for creating new workout.

Workout Detail - Log Tab

The left screenshot shows a timeline of workout logs. Each log item includes the date, duration, and time. By clicking on an item, it expands to show detailed exercise information, such as exercise name and number of repeats. A floating Action Button is located at the bottom right corner.

Date	Duration	Time	Exercise Name	Reps
03/21	45	15:00 - 15:45	Exercise name 1	10
			Exercise name 2	6
			Exercise name 1	12
			Exercise name 2	10
03/24	45	15:00 - 15:45		
03/26	45	15:00 - 15:45		
03/28	45	15:00 - 15:45		
03/29	45	15:00 - 15:45		

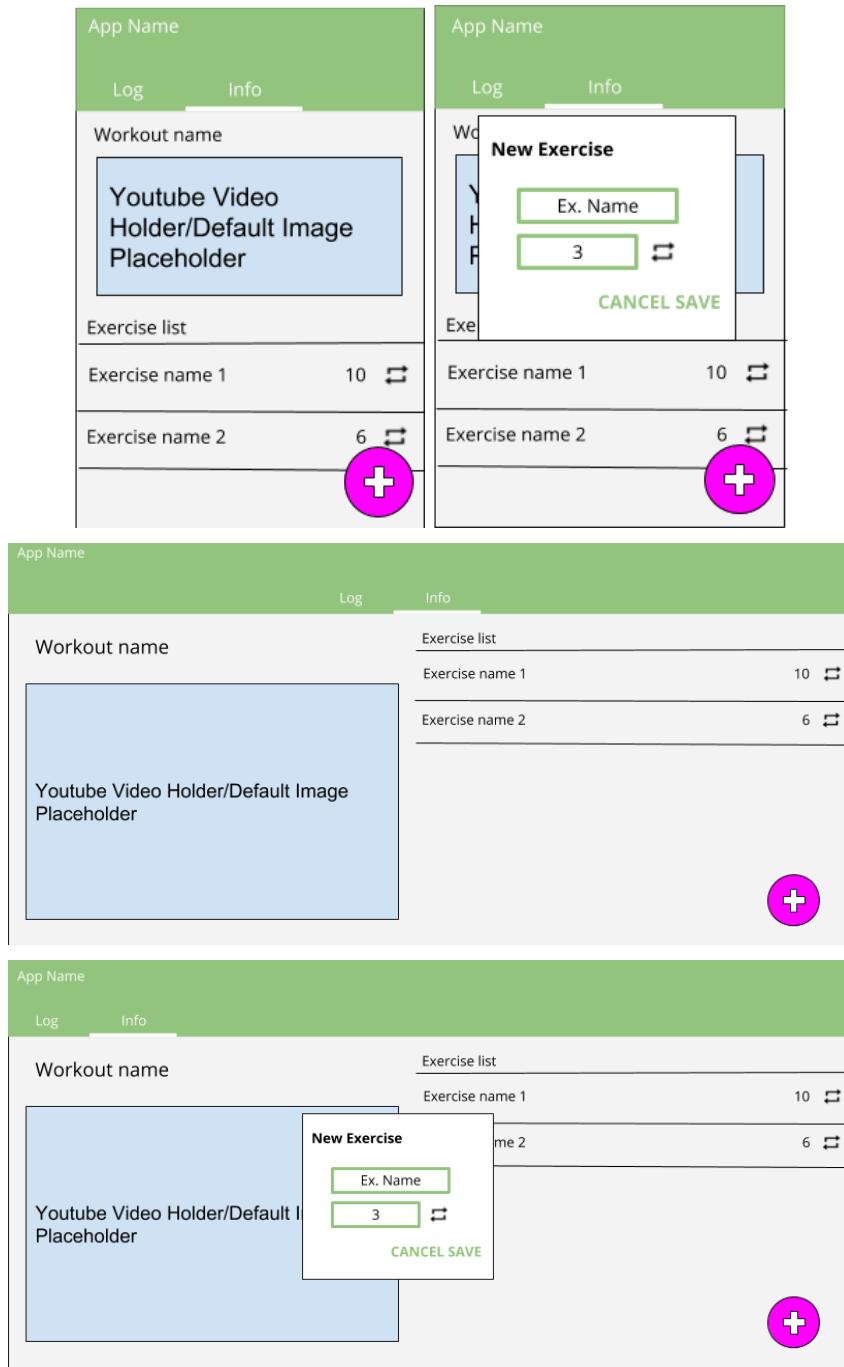

The right screenshot shows a detailed view of a log item. It includes the date, duration, time, exercise name, and reps. A floating Action Button is located at the bottom right corner.

Date	Duration	Time	Exercise Name	Reps
03/21	45	15:00 - 15:45	Exercise name 1	10
			Exercise name 2	6
			Exercise name 1	12
			Exercise name 2	10

The workout detail screen contains two tabs. The first is the workout log. It will show a log of the workout's activity. The log is designed as timeline. At the beginning each log item shows the date, the minutes duration and the time of the activity. By clicking on the item. It shows a detailed exercise information. This information contains the name and the number of repeats for every exercise.

A floating Action Button is placed on the bottom right corner of the screen. It is used for creating new workout activity.

Workout Detail - Info Tab

The workout detail screen contains two tabs. The second is the workout info. It shows a field for the workout name. The name could be edited by clicking on the name field. A dialog is displayed with a single text input field. User enters the workout name and clicks save. The newly entered value is displayed in the workout name field.

Below the name field is the YouTube video placeholder/player. If a video is embedded then the placeholder is displayed as a YouTube video player with embedded video preloaded. If YouTube video is not embedded then a default image placeholder will be displayed.

The screen displays a workout plan with a list of the exercises included in the plan. Every exercise information contains the name and the planned number of repeats.

A exercise can be edited or deleted by clicking on it. A dialog will be displayed with fields for editing the name and repeats of the exercise. The dialog will contain also a extra button for deleting the exercise.

A floating Action Button is placed on the bottom right corner of the screen. It is used for creating new plan exercise. A dialog will be displayed with fields for editing the name and repeats of the exercise.

Workout Activity

The screenshots illustrate the workflow for creating and editing a workout activity:

- Initial State:** Shows a placeholder for an optional YouTube video and a timer at 00:45:30. A green floating action button (+) is in the bottom right.
- Exercise Selection:** A modal dialog titled "Select Exercise" lists "Exercise name 1" and "Exercise name 2". A green input field shows "3" with a double-headed arrow, indicating repeat counts. Buttons for "CANCEL" and "SAVE" are at the bottom.
- Exercise List:** Shows a list of exercises with repeat counts (10 for Exercise name 1, 6 for Exercise name 2). A green floating action button (+) is in the bottom right.
- Exercise Edit:** A modal dialog titled "Select Exercise" shows the same list of exercises with repeat counts (10 for Exercise name 1, 6 for Exercise name 2). A green input field shows "3" with a double-headed arrow. Buttons for "CANCEL" and "SAVE" are at the bottom.

The workout activity screen contains a YouTube video (if embedded in the workout info), list of exercises completed in the activity and a timer showing the time passed since the activity start. Every exercise contains the name and the number of repeats.

A exercise can be edited or deleted by clicking on it. A dialog will be displayed with fields for editing the name and repeats of the exercise. The dialog will contain also a extra button for deleting the exercise.

Two action buttons will be placed on the toolbar. The first is for saving the activity, the second is for canceling the activity.

A floating Action Button is placed on the bottom right corner of the screen. It is used for creating new activity exercise. A dialog will be displayed with list of all available exercises for this workout and a text enter field for editing the repeats count.

Key Considerations

How will your app handle data persistence?

The app will use Firebase Realtime Database. User will be able to sign in with phone, email or Google account. All user data will be stored in the cloud.

Describe any edge or corner cases in the UX.

When the app initially starts a sign in/sign up screen is shown. After a successful authentication the user is redirected to the main screen of the app - the Workouts list. The user presses the create workout button ar selects a specific workout. The app then shows the Workout Detail screen. If a new workout is creating then the top right action buttons will be SAVE and CANCEL (also Workout Activity Log is empty and the new Workout Activity button is hidden), otherwise EDIT and DELETE. User can now add exercises to the Workout Plan or start a new Workout Activity. The app navigates to the Workout Activity screen. The Workout Activity can be saved or canceled.

Describe any libraries you'll be using and share your reasoning for including them.

YouTube Player API - embeds and plays the workout related YouTube video.

Firebase API - responsible for data persistence and user authentication.

Butter Knife - field and method binding for views

Describe how you will implement Google Play Services or other external services.

The app will use Google Firebase Service. It will handle data persistence and user authentication using its Android API. The service provides mechanisms for writing, reading and querying data stored on the cloud.

YouTube Player API will be used for playing embedded YouTube videos. The service provides player view which plays the video in a way the user is familiar. The player provides all the controls needed for managing the video playback.

Next Steps: Required Tasks

This is the section where you can take the main features of your app (declared above) and break them down into tangible technical tasks that you can complete one at a time until you have a finished app.

Task 1: Project Setup

The project development will begin by adding dependencies to the libraries that will be used in the project (Firebase, YouTube Player and Butter Knife). The project configuration must be specified (Min SDK, Target SDK and etc.)

Task 2: Implement Activities and Fragments

- Authentication - implement Firebase Authentication UI;
- Workouts List - implement recyclerview for workout items and floating action button for new workout action;
- Workout Detail - implement tablayout and two fragment for each tab - Workout Activity Log and Workout Info
 - Workout Activity Log - implement timeline recyclerview with expansion feature;
 - Workout Info - implement YouTube Player API, recyclerview for workout plan exercises and new exercise dialog;
- Workout Activity - implement YouTube Player API, recyclerview for workout activity exercises and timer view.

Task 3: Implement Free and Paid flavors

Implement two different flavors for free and paid version of the app. The free version will contain ads and the paid one will be without ads.

Implement Ads throughout the app. A banner ad will be placed in Workout List and Workout Detail screens.
